(a) Two occupation observables
Deviation / initial deviation
γt
$\Delta_{\mathrm{all}} = 0.572\gamma$
$\Gamma_D = 1.118\gamma$
$\Gamma_N = 1.679\gamma$
$N/n - \nu_*$
$D = n_1 - n_2$
$e^{-\Delta_{\mathrm{all}} t}$ (reference)
(b) Unequal readout weights
$-\partial_t \ln |\langle O_\eta \rangle - \nu_*| / \gamma$
γt
Γ_N
Γ_D
$\eta = 0$
$\eta = 0.1$
$\eta = 1$
(c) Conditional survival cost
$P_{\mathrm{surv}}(t)$
γt
6.0e-06
1.2e-15
2.0e-25
$n = 12,\ d = 3,\ z = 1/144$
